### **Des-Case Corporation unveils new product** *Oil coalescing breather offers many benefits*

*White House, Tenn.*—Des-Case Corporation today unveiled its oil coalescing breather, which provides 2-micron filtration for gear-driven pumps and other applications that emit oil mist. The product, identified as the DC-OC2, offers two-fold benefits by protecting both system lubricants and the environment.

“This product was born at the request of one of our paper mill customers,” said Jim Waller, president of Des-Case Corporation. “They identified the need which led us to this new product rollout. The DC-OC2 fills a void in the marketplace.”

The Des-Case oil coalescing breather is a simple, yet effectively designed breather cap. The plastic housing contains a foam filter to disperse air and a microglass oil coalescing media that prohibits entry of abrasive contaminants and captures oil mist. Oil droplets are then recycled back into the system. The breathers are rated for 5 cfm and incorporate a standard 3/8" female standpipe connector. A cost-effective solution for a large number of applications, the breathers are disposable and require changeover about every six months.

Like all Des-Case breathers, the DC-OC2 reduces unnecessary wear and tear on equipment, prolonging the life of both machinery and lubricants.

Headquartered in White House, Tenn., Des-Case is one of the largest providers of desiccant breathers to a wide variety of industries. The companies' products feature a design unparalleled in the marketplace and are protected by two U.S. patents. Des-Case breathers are sold through an international distribution network.
